## Dorian Sawa - Logical ability

Alva's logic test assesses logical ability, i.e., how efficiently one processes complex information and draws accurate conclusions from it.

### Above average

98th percentile and above.

Your score on the logic test is 10, which is above average.

Alva Labs interprets logical ability by benchmarking your score against *others* in the working population. A score of *above average* indicates a person often requires considerably less time and effort to interpret abstract information and form logical conclusions.

People with similar scores often have the ability to acquire and apply new knowledge, interpret abstract information and reason logically. They tend to enjoy working with intellectually demanding problems and thus need to feel challenged to enjoy their work.

Keep in mind when interpreting your results that *logical ability is far from the only factor* determining job performance or career success. Personality, motivation, values, and experience are also important, and strengths in one area *may outweigh weaknesses* in another.

\* The most common standard scores are 5 and 6. The percentile ranges for these scores are wide due to the fact that they cover a large proportion of the population.

### Logic test results distribution

The difficulty of each task is dependent on the tasks that you answer correctly. This graph shows the difficulty of all the tasks that you have responded to, with green indicating correct answers and red incorrect ones. The test tries to find your highest potential logical ability, meaning that you should see more correct answer below your final score, and more incorrect above it.
